

# ZFS

If you do this, you will break something. DO NOT run production on this SR. If you do, I hope you trust your backups.

Install/enable ZFS on your hosts

On each host that you want to run ZFS:

```
yum install --enablerepo="xcp-ng-extras" blktap vhd-tool
```

Install ZFS packages built for XCP-ng: (check version)

```
yum install --enablerepo="xcp-ng-extras" kmod-spl-4.4.0+10 kmod-zfs-4.4.0+10 spl zfs
```

Enable the module with

```
depmod -a && modprobe zfs .
```

Create a new ZFS pool:

Create the new SR.

Disable sync.

```
zfs set sync=disabled tank
```
